# Motivations

- Top-down estimates: different magnitude of SO<sub>2</sub> emissions

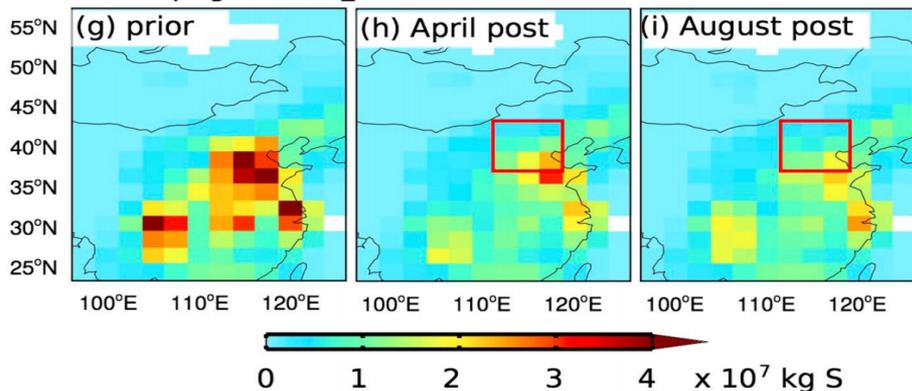

# Motivations

3

- Top-down estimates: different magnitude of SO<sub>2</sub> emissions
- Top-down emissions in China: 843 Gg S in April 2008 from Wang et al. [2016], but 1542 Gg S from Koukouli et al. [2018].

constrained by OMI NASA product (2008)

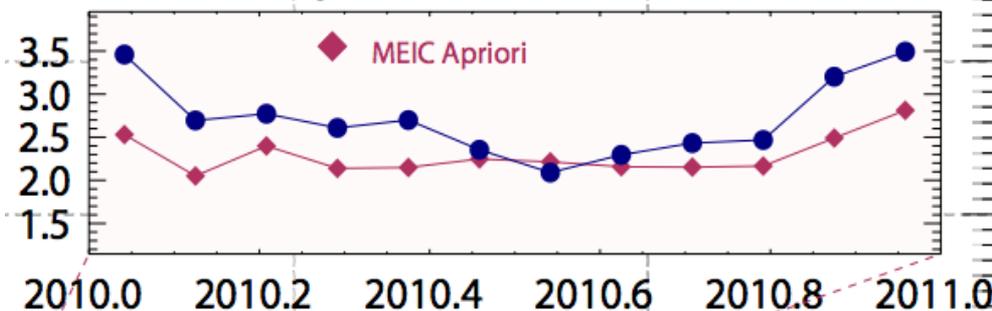

Anthropogenic SO<sub>2</sub> emissions

(Wang et al. 2016)

constrained by OMI BIRA product (2010)

Reference year 2010

(Koukouli et al. 2018)

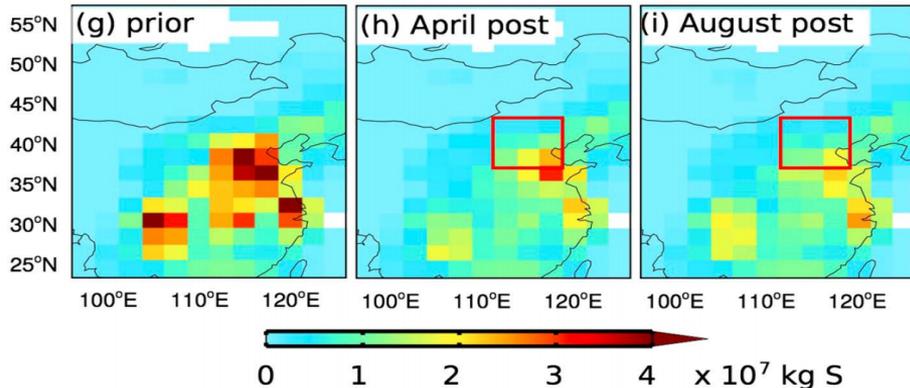

# Motivations

4

- Top-down estimates: different magnitude of SO<sub>2</sub> emissions
  - Top-down emissions in China: 843 Gg S in April 2008 from Wang et al. [2016], but 1542 Gg S from Koukouli et al. [2018].
  - Lack of detailed comparison & evaluation of the magnitude, seasonality, and inter-annual variation of the newest OMI SO<sub>2</sub> retrievals.

## constrained by OMI NASA product (2008)

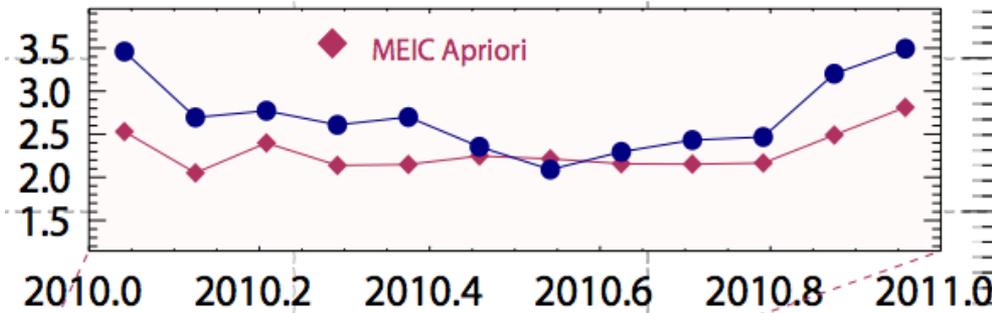

Anthropogenic SO<sub>2</sub> emissions

(Wang et al. 2016)

## constrained by OMI BIRA product (2010)

Reference year 2010

(Koukouli et al. 2018)

# Evaluation of OMI SO<sub>2</sub> retrievals

- Three products: NASA standard (SP), NASA prototype, BIRA

# Evaluation of OMI SO<sub>2</sub> retrievals

6

- Three products: NASA standard (SP), NASA prototype, BIRA

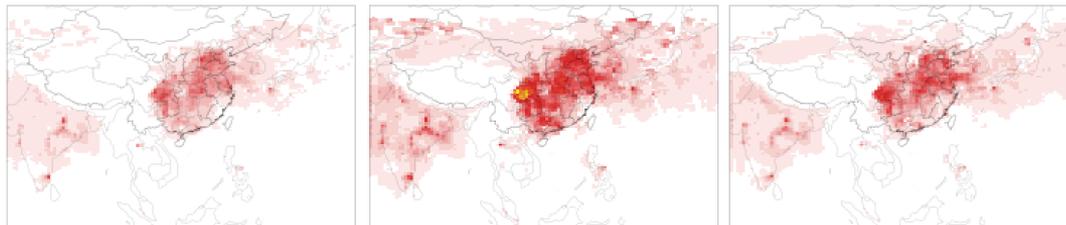

## SO<sub>2</sub> slant column density (SCD)

NASA SP v3

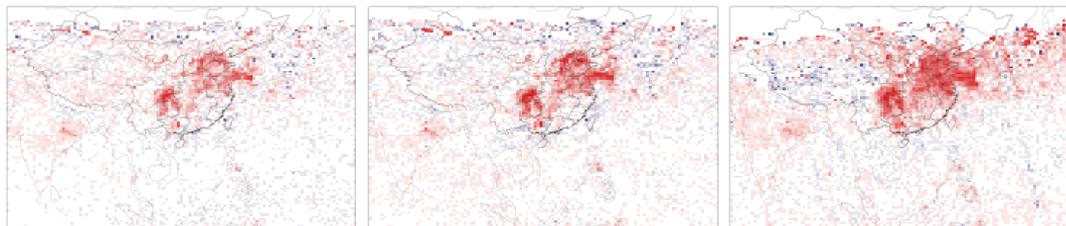

NASA prototype

BIRA

GC

OMI

- GC column:  
NASA prototype > BIRA
- OMI column: NASA < BIRA
- more positive GC – OMI →  
more decrease of emissions  
using NASA product

(Qu et al., 2019a)

# Evaluation of OMI SO<sub>2</sub> retrievals

7

- Three products: NASA standard (SP), NASA prototype, BIRA
- Differences in model and OMI column drives emission estimates

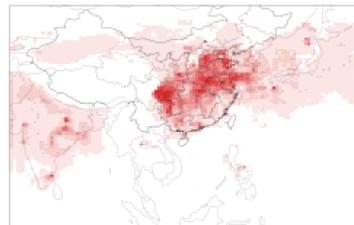

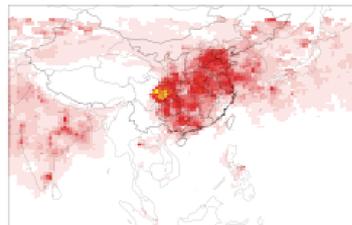

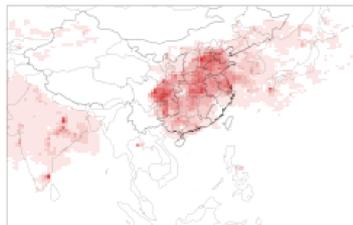

## SO<sub>2</sub> slant column density (SCD)

NASA SP v3

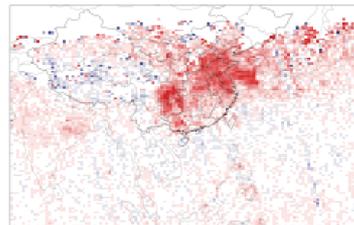

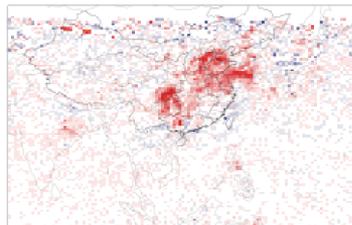

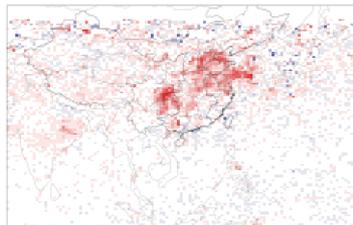

NASA prototype

BIRA

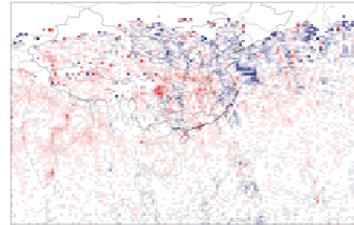

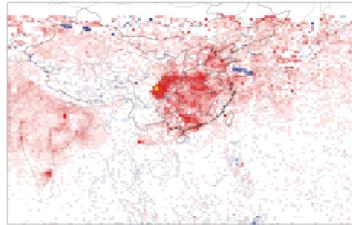

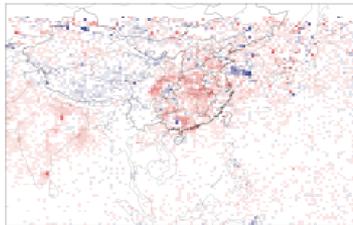

GC

OMI

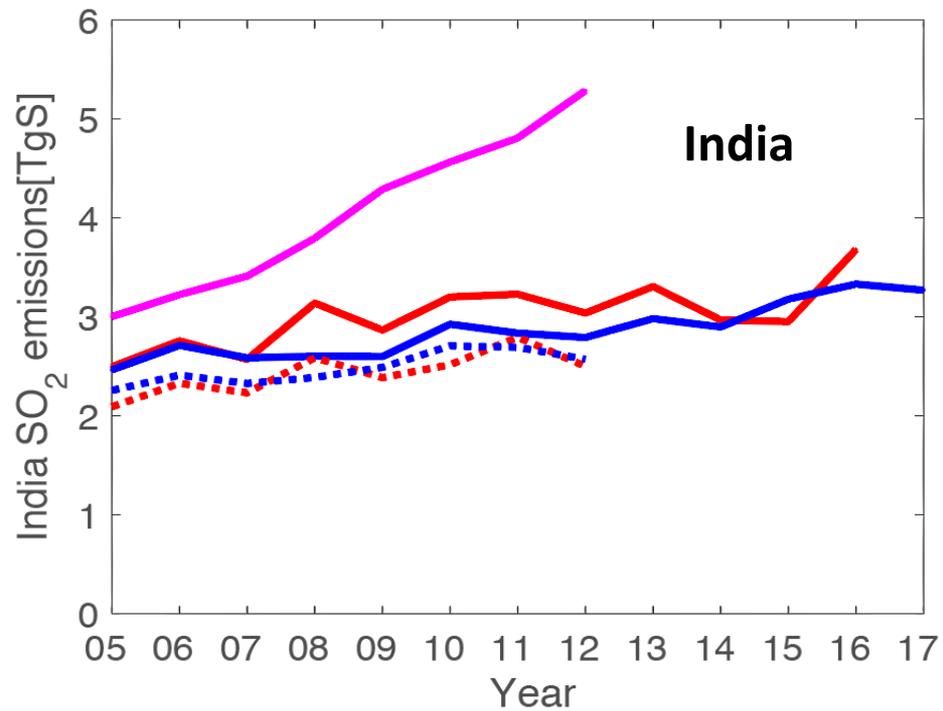

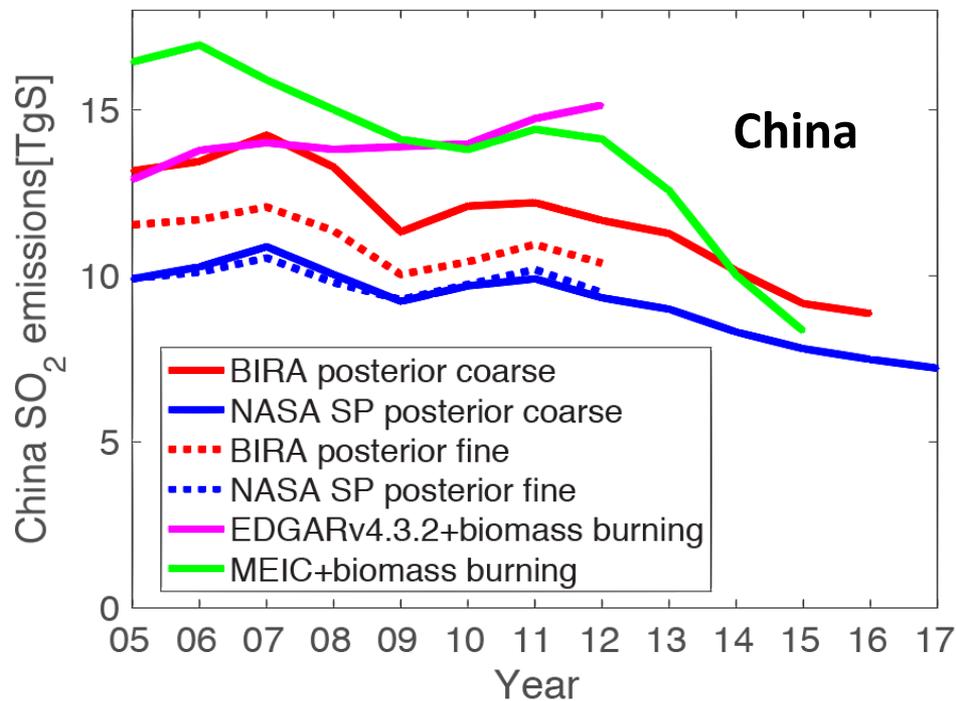

GC - OMI

- GC column:  
NASA prototype > BIRA
- OMI column: NASA < BIRA
- more positive GC - OMI →  
more decrease of emissions  
using NASA product
- GC - OMI: more consistent at  
low latitude (small VZA) and in  
July in NH (small SZA)

(Qu et al., 2019a)

# Trend of SO<sub>2</sub> emissions

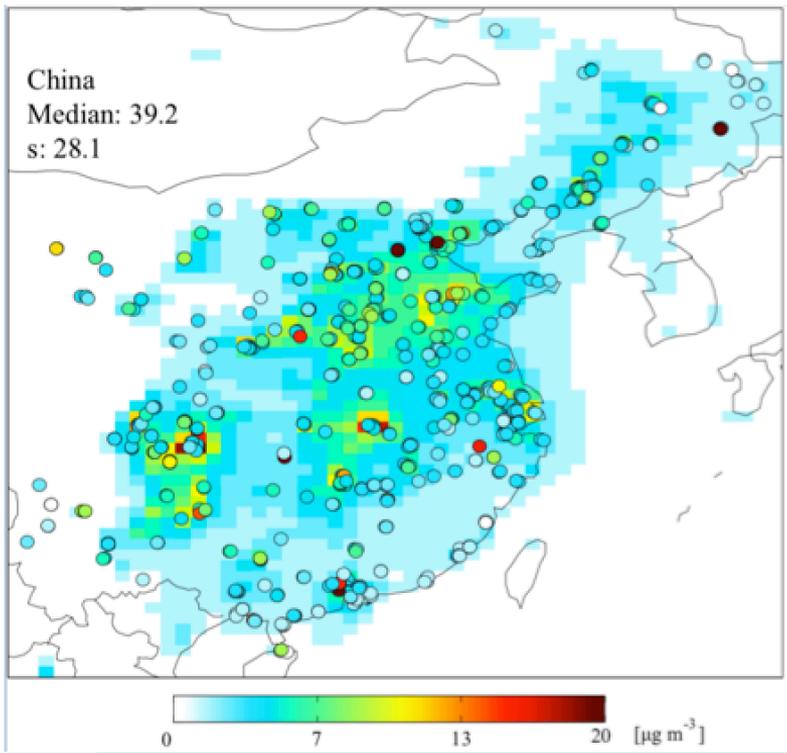

- From GEOS-Chem 4D-Var

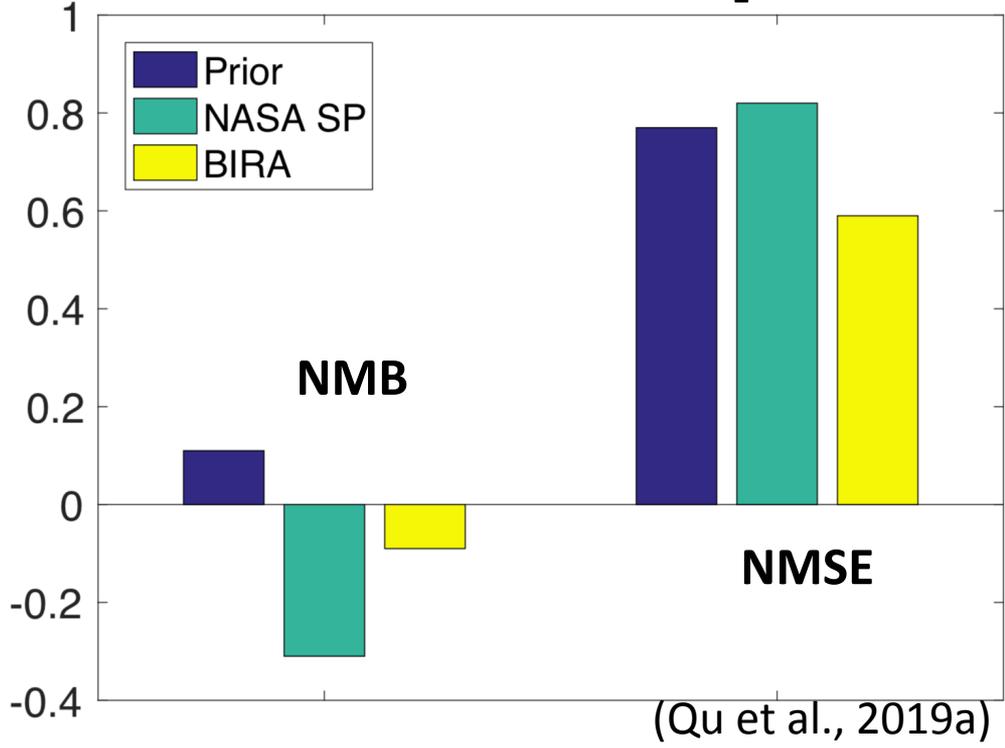

# Mixed performance compared with surface measurement<sup>9</sup>

- Reduced NMB and NMSE in China using BIRA posterior, but increased using NASA SP posterior.

Annual mean surface SO<sub>2</sub> concentration (2010)

NMB & NMSE of surface SO<sub>2</sub> in China

## Mixed performance compared with surface measurement<sup>10</sup>

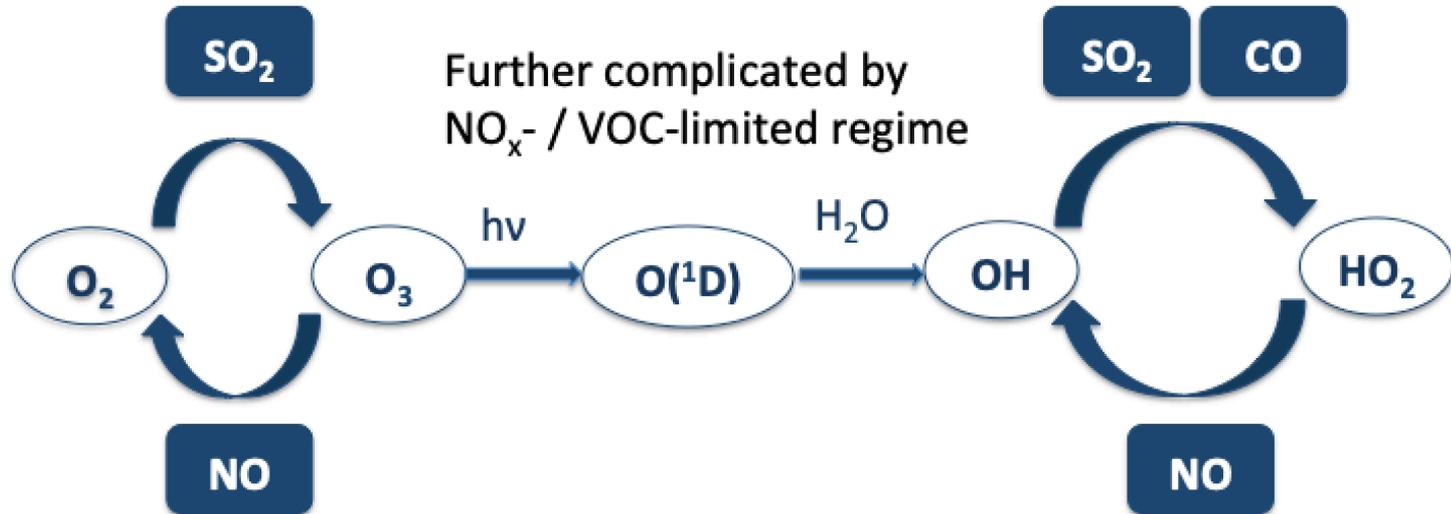

- Reduced NMB and NMSE in China using BIRA posterior, but increased using NASA SP posterior.
- China, South Korea and India: the NASA posteriors have better statistics in seasonality but worse in spatial variability and trend than BIRA posteriors.
- US: the NASA posteriors have better seasonality and spatial variability.

# Top-down SO<sub>2</sub> emissions

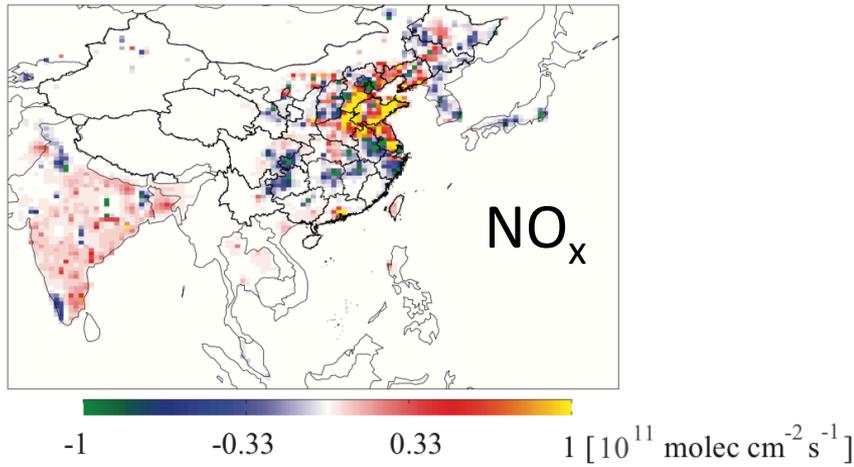

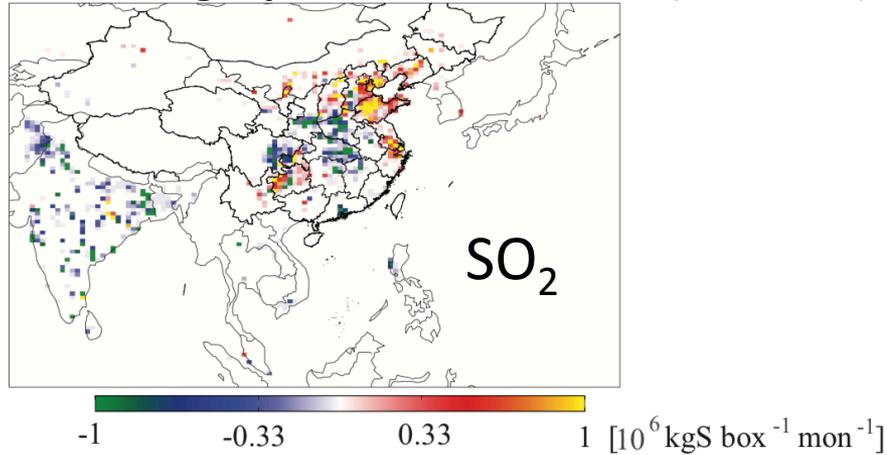

11

## Still ...

- Chemical interactions are not being considered so far
- Uncertainties in other species emissions are likely degrading the top-down emission of the constrained species

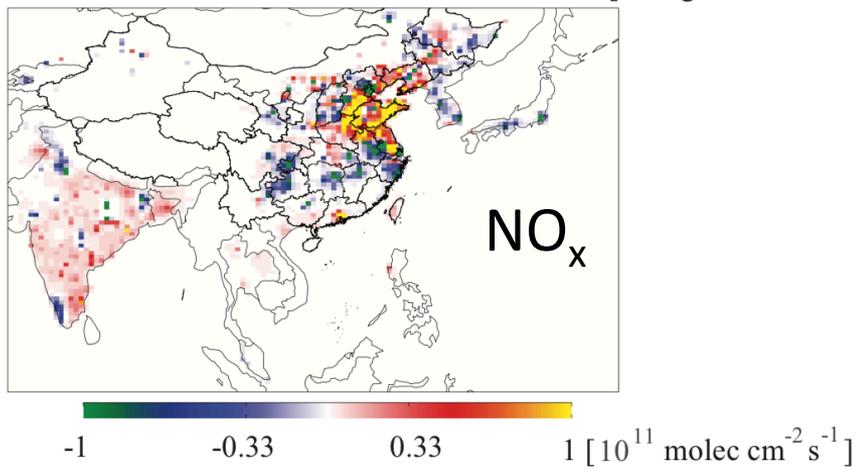

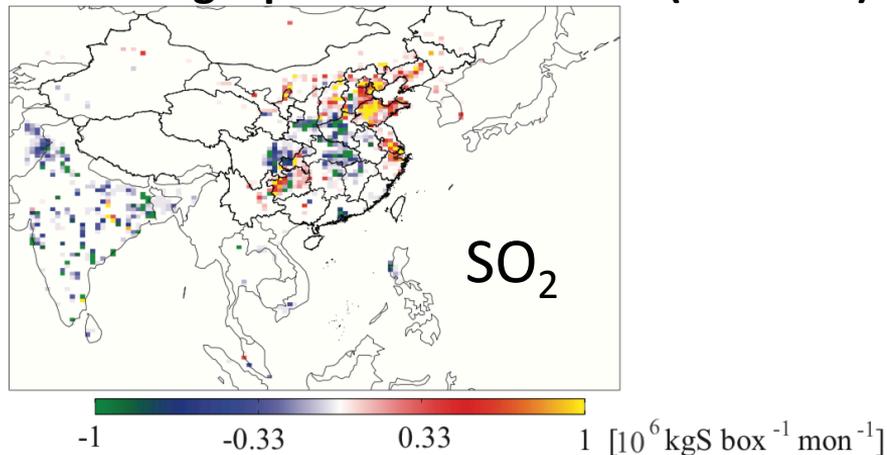

## Joint – Single posterior emissions (Jan 2010)

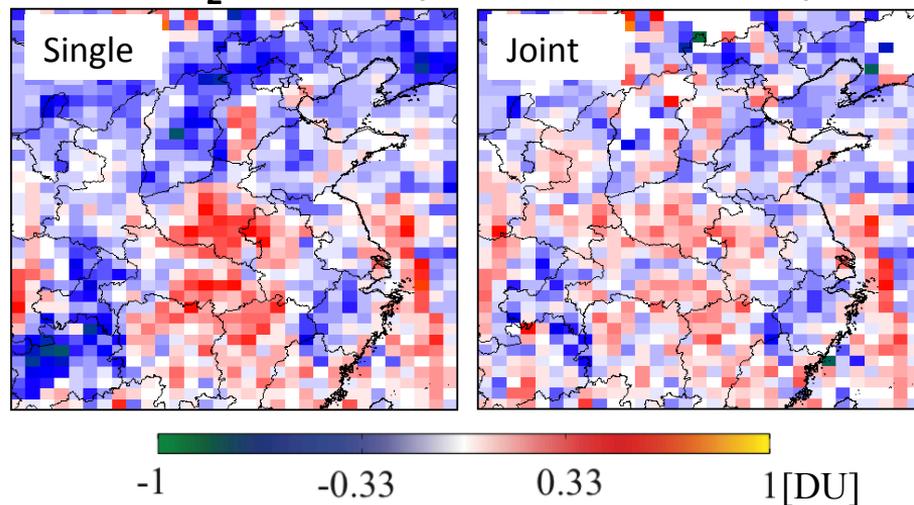

**Joint:** assimilate NO<sub>2</sub> and SO<sub>2</sub> observations to optimize NO<sub>x</sub> and SO<sub>2</sub> emissions simultaneously

**Single:** only assimilate NO<sub>2</sub> (SO<sub>2</sub>) observations to optimize NO<sub>x</sub> (SO<sub>2</sub>) emissions

## Joint – Single posterior emissions (Jan 2010)

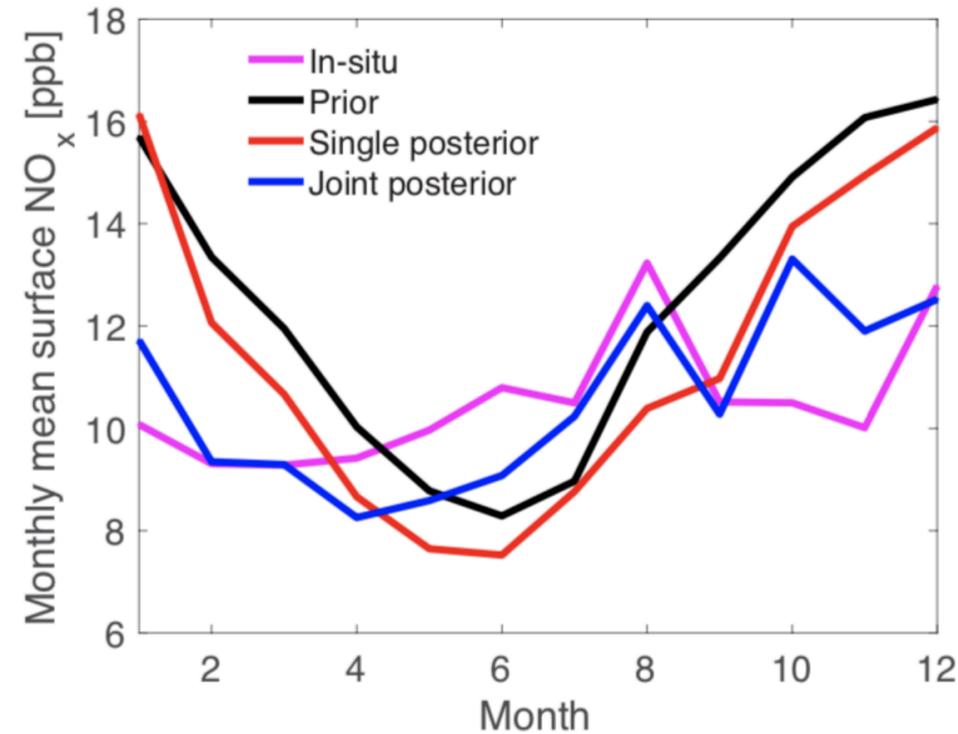

## SO<sub>2</sub> columns (GEOS-Chem – OMI)

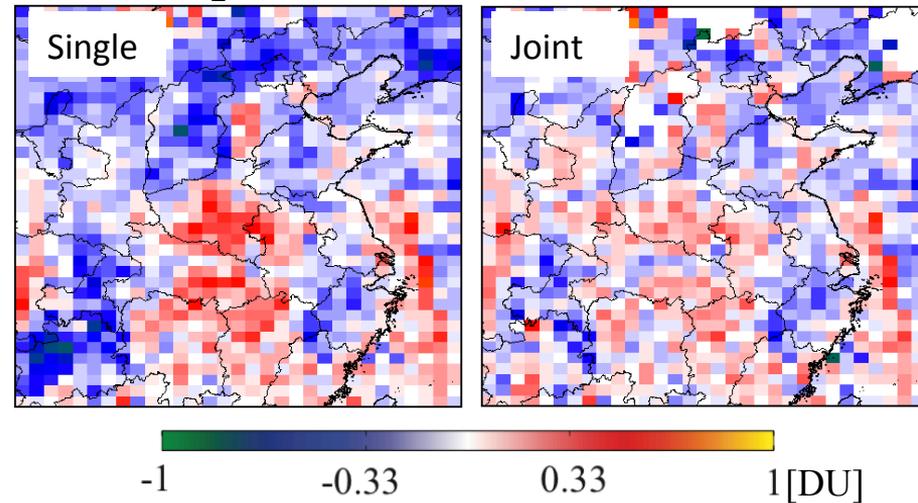

- Better match satellite and surface NO<sub>2</sub> and SO<sub>2</sub> measurements when satellite retrievals of the species being optimized have large uncertainties.

## Surface NO<sub>x</sub> concentration in India (2010)

## SO<sub>2</sub> columns (GEOS-Chem – OMI)

- Better match satellite and surface NO<sub>2</sub> and SO<sub>2</sub> measurements when satellite retrievals of the species being optimized have large uncertainties.

## Transportation

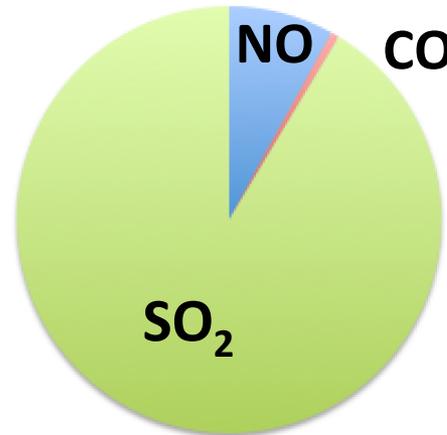

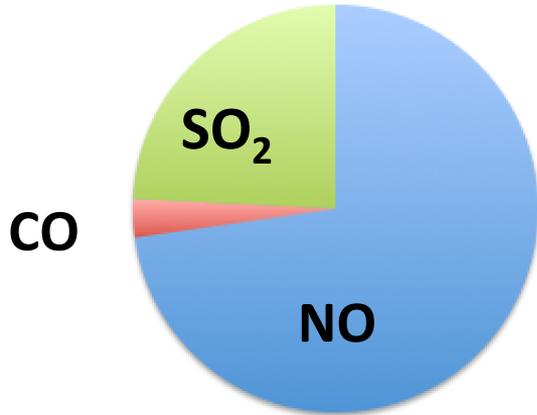

## Energy

**Sector-based emission scaling factor**

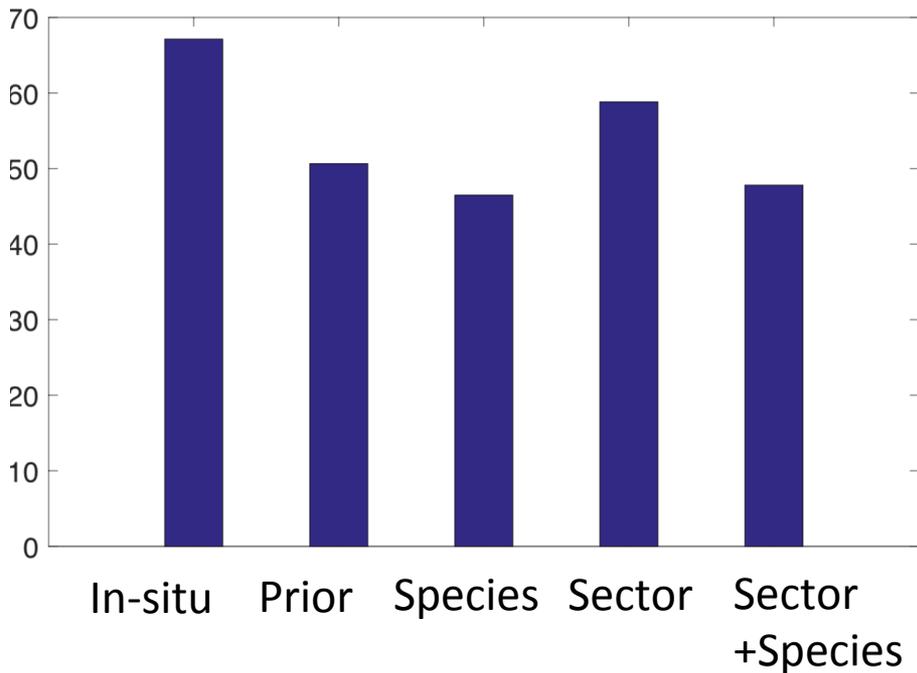

**Assimilate:**

- MOPITT CO
- OMI NO<sub>2</sub>
- OMI SO<sub>2</sub>

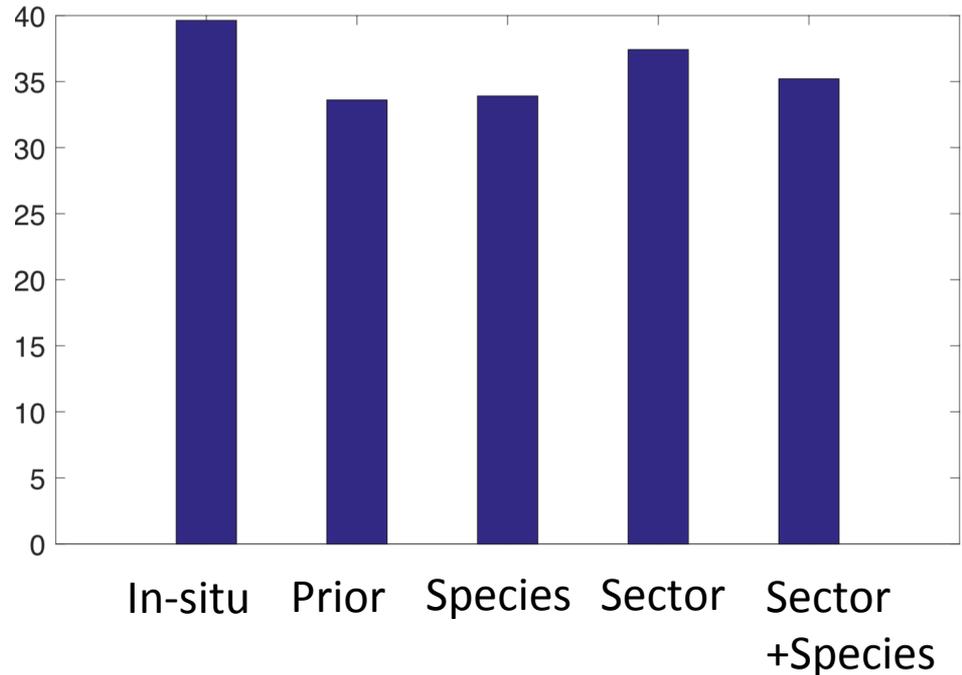

**Similar ratio of NO<sub>x</sub>, SO<sub>2</sub> and CO emissions in the same sector, yet very different across sectors.**

## Surface SO<sub>2</sub> concentrations in China [ug m<sup>-3</sup>]

## Surface NO<sub>2</sub> concentrations in China [ug m<sup>-3</sup>]

- NMB of posterior simulations from sector-based inversions are 59.8% (SO<sub>2</sub>) and 61.4% (NO<sub>2</sub>) smaller than the ones from species-based inversion.

## Take home messages:

- Treatment of clouds, radiative transfer model, and retrieval algorithm lead to differences in NASA and BIRA SO<sub>2</sub> retrievals, which are most consistent when VZA and SZA are small;
- SO<sub>2</sub> emissions continuously increase in India from 2005 - 2017 and start to decrease in China from 2008;
- Reduced error in NO<sub>x</sub> and SO<sub>2</sub> top-down emissions using multiple species joint inversion, through correction of OH concentration in the model, at months when observation uncertainties of optimized species are large;
- A new sector-based inversion is developed to estimate emissions at process level using satellite observations.
