

A New Tropospheric Ozone Data Product Derived from DSCOVR EPIC v3 Measurements

J. R. Ziemke, N. A. Kramarova, L. K. Huang, J. R. Herman,
P. K. Bhartia, and K. Wargan

NASA Goddard Space Flight Center, Greenbelt, Maryland, USA

DSCOVR EPIC and NISTAR STM

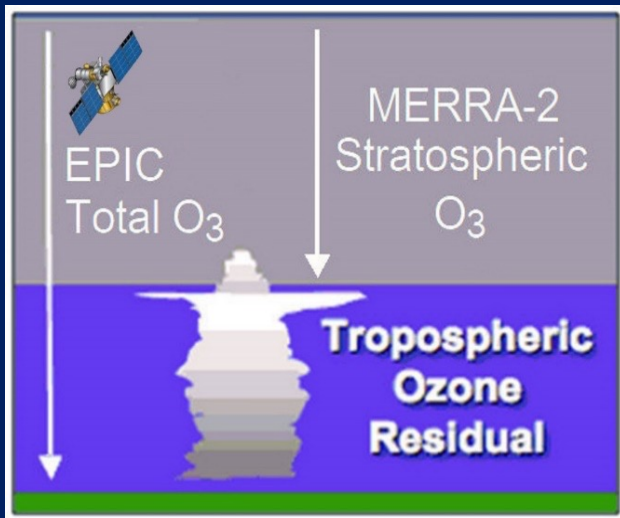

28-30 September 2021

Data Details

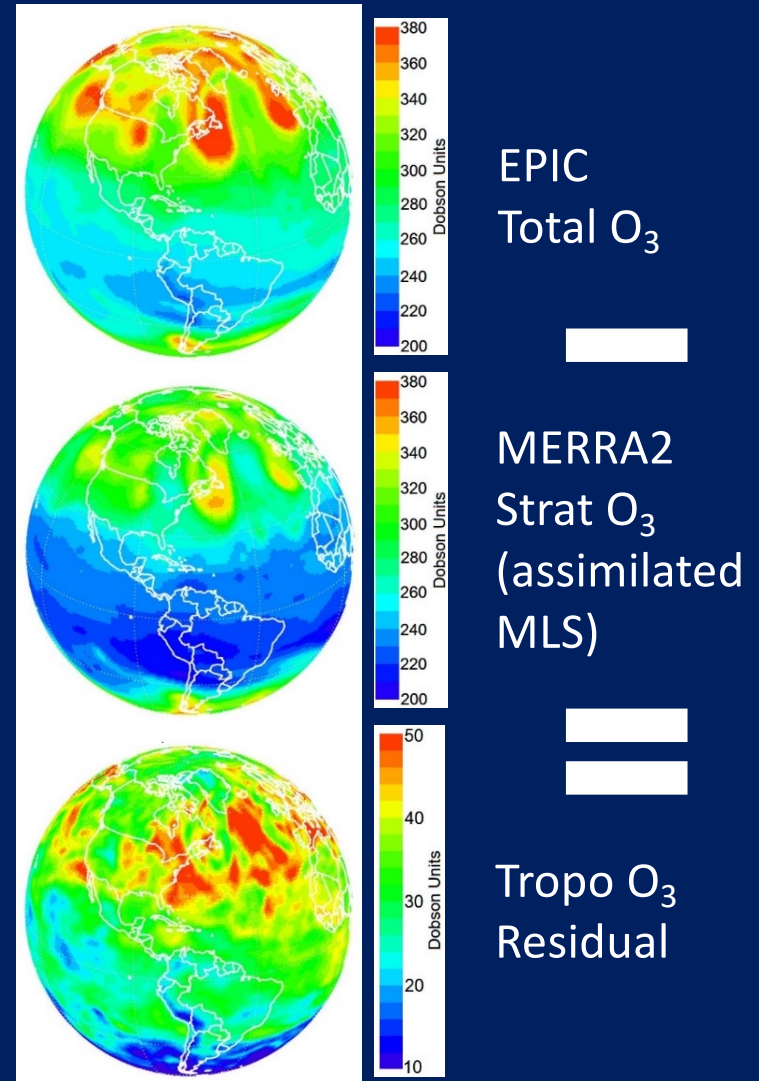

- Synoptic gridded v3 maps every 1-2 hours @ $1^\circ \times 1^\circ$ binning over sunlit disk of Earth
- File variables (HDF5 file format): Tropospheric column ozone (both corrected and not corrected arrays for reduced BL sensitivity to ozone), stratospheric column ozone, tropopause pressure, cloud pressure, radiative cloud fraction, reflectivity, data quality flags, etc.
- Time record: June 2015-August 2021 (~1 month lag due to MERRA2 vetting)
- Status: Data on NCCS ready for upload to ASDC

Tropospheric Ozone Residual (TOR) Method

Residual Method:

$$\text{Tropo Column O}_3 \text{ Residual} = \text{EPIC Total O}_3 - \text{MERRA2 Strat O}_3$$

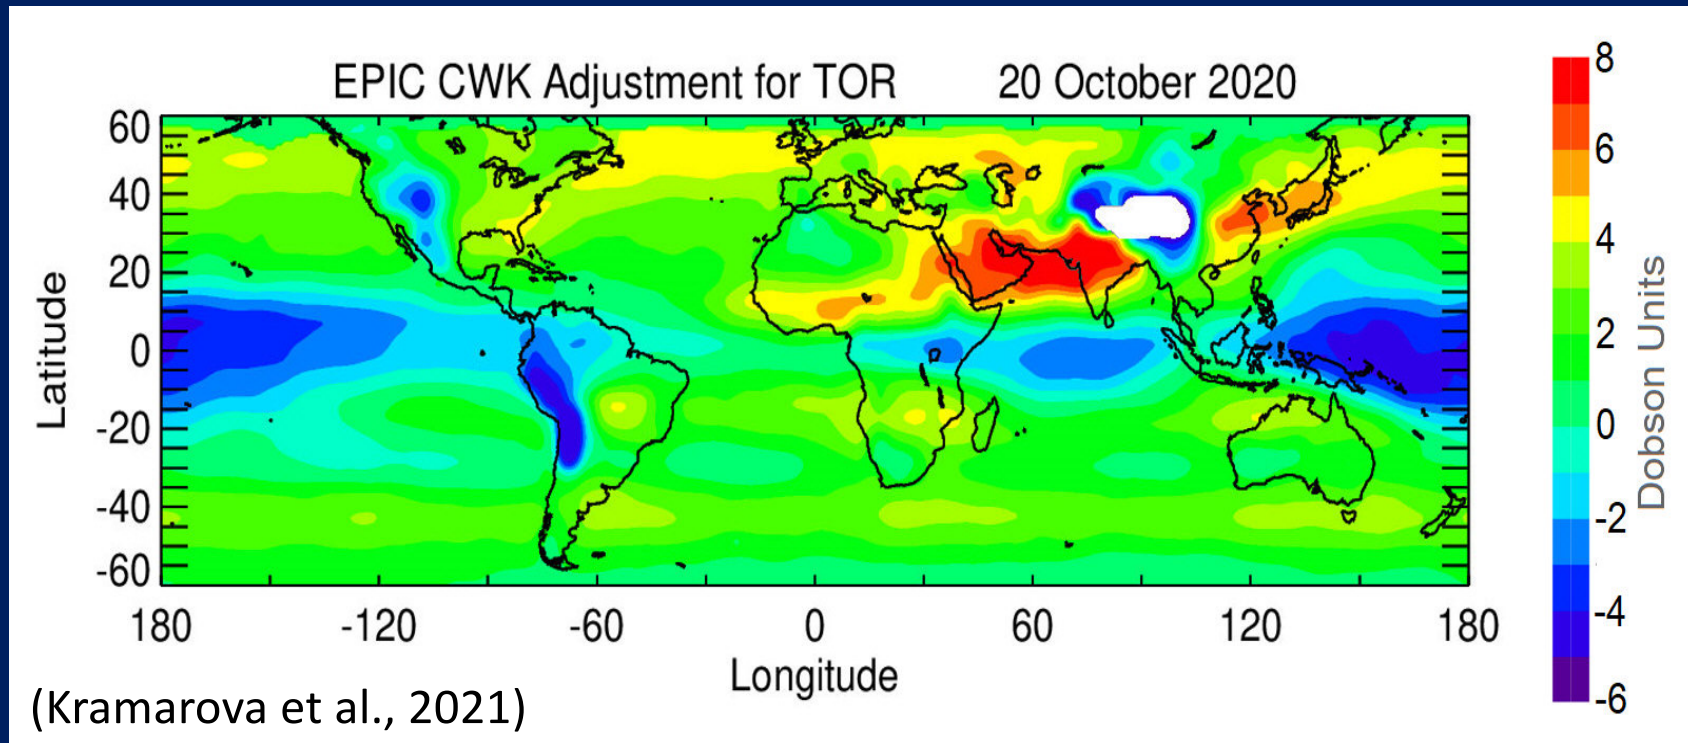

Tropopause pressure: From combining MERRA-2 potential vorticity (2.5 PVU) and potential temperature (380 K)

MERRA2 Strat O₃: Co-located to exact time and location of EPIC L2 footprints (accuracy & precision ~2-3 DU & 2-5 DU)

EPIC: All satellite zenith angles < 70°

EPIC Column-Weighting Function Daily Adjustments for BL O₃

$$\Delta\Omega = [1 - \text{CWF}(0)] \cdot [\text{GMI}(0) - \text{AP}(0)]$$

where $\text{GMI}(0)$ = daily 2015-2020 climatological layer 0 (gnd-to-506hPa) column O₃, and $\text{AP}(0)$ = a priori layer 0 column O₃

EPIC Provides Many Measurements at a Given Location Per Day Compared to Polar Orbiters

Important for cross-validating geostationary satellite measurements such as current GEMS, and upcoming TEMPO and Sentinel-4

(Missing/bad data not included in averaging)

(Kramarova et al., 2021)

Validation: EPIC vs OMI and OMPS Daily TOR

Biomass burning in California and Brazil in September 2020 produced ozone in the troposphere

EPIC/M2 Measures Global TOR Each Day

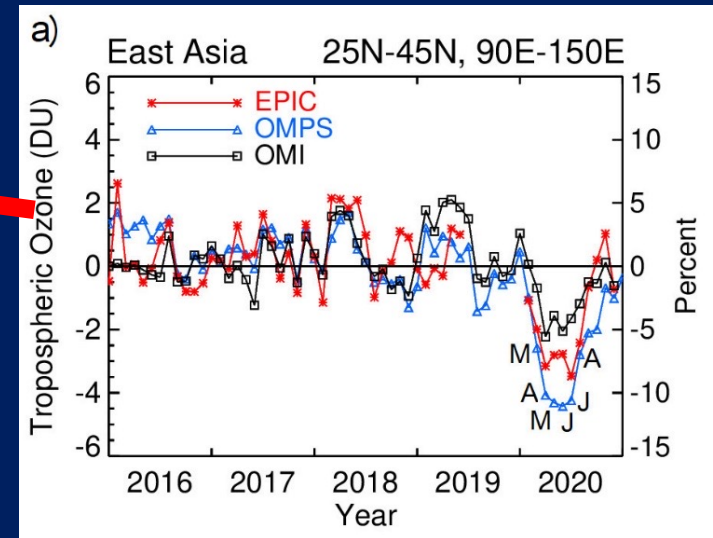

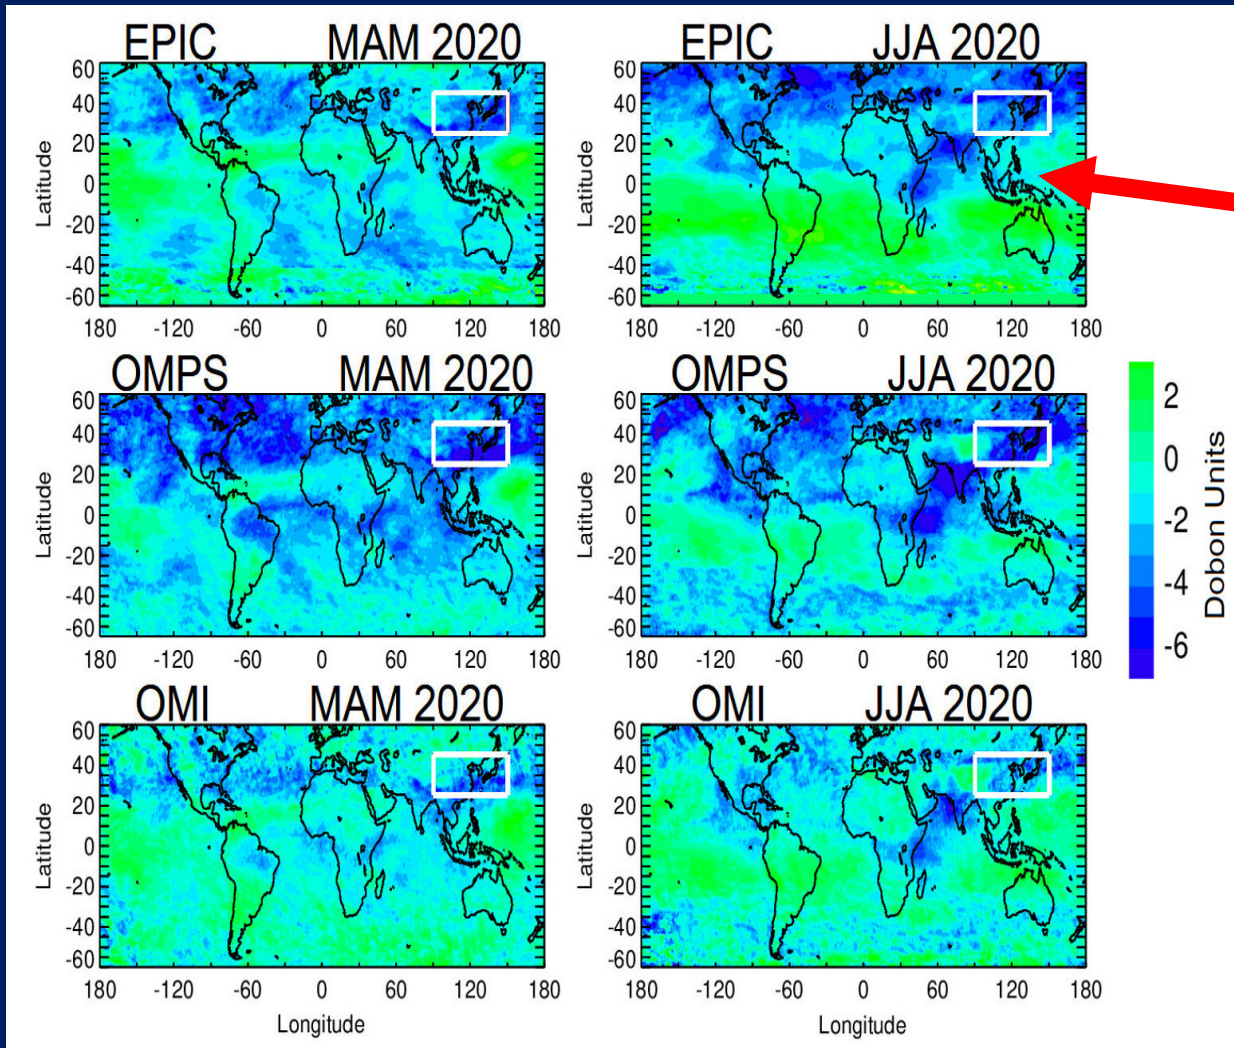

EPIC is now Developing a Long Record of TOR

(Kramarova et al., 2021)

Regional Patterns of the NH Tropospheric Ozone Reductions in 2020

Steinbrecht et al. (2021, GRL):

7% reduction throughout NH free troposphere in spring-summer 2020 from sondes, lidar, model

Bouarar et al. (2021, GRL):

5-15% reduction of zonal-mean tropospheric ozone in 2020 from the CAM-Chem model

(Anomalies: Relative to 2016-2019 Average Fields)

Conclusions

- EPIC provides maps of tropospheric ozone for studying variability from hourly to inter-annual timescales
- EPIC TOR maps every 1-2 hours is unique and is useful as a “pathfinder” for new geostationary platforms (*e.g., current GEMS, and upcoming TEMPO and Sentinel-4*)

Extra Plots

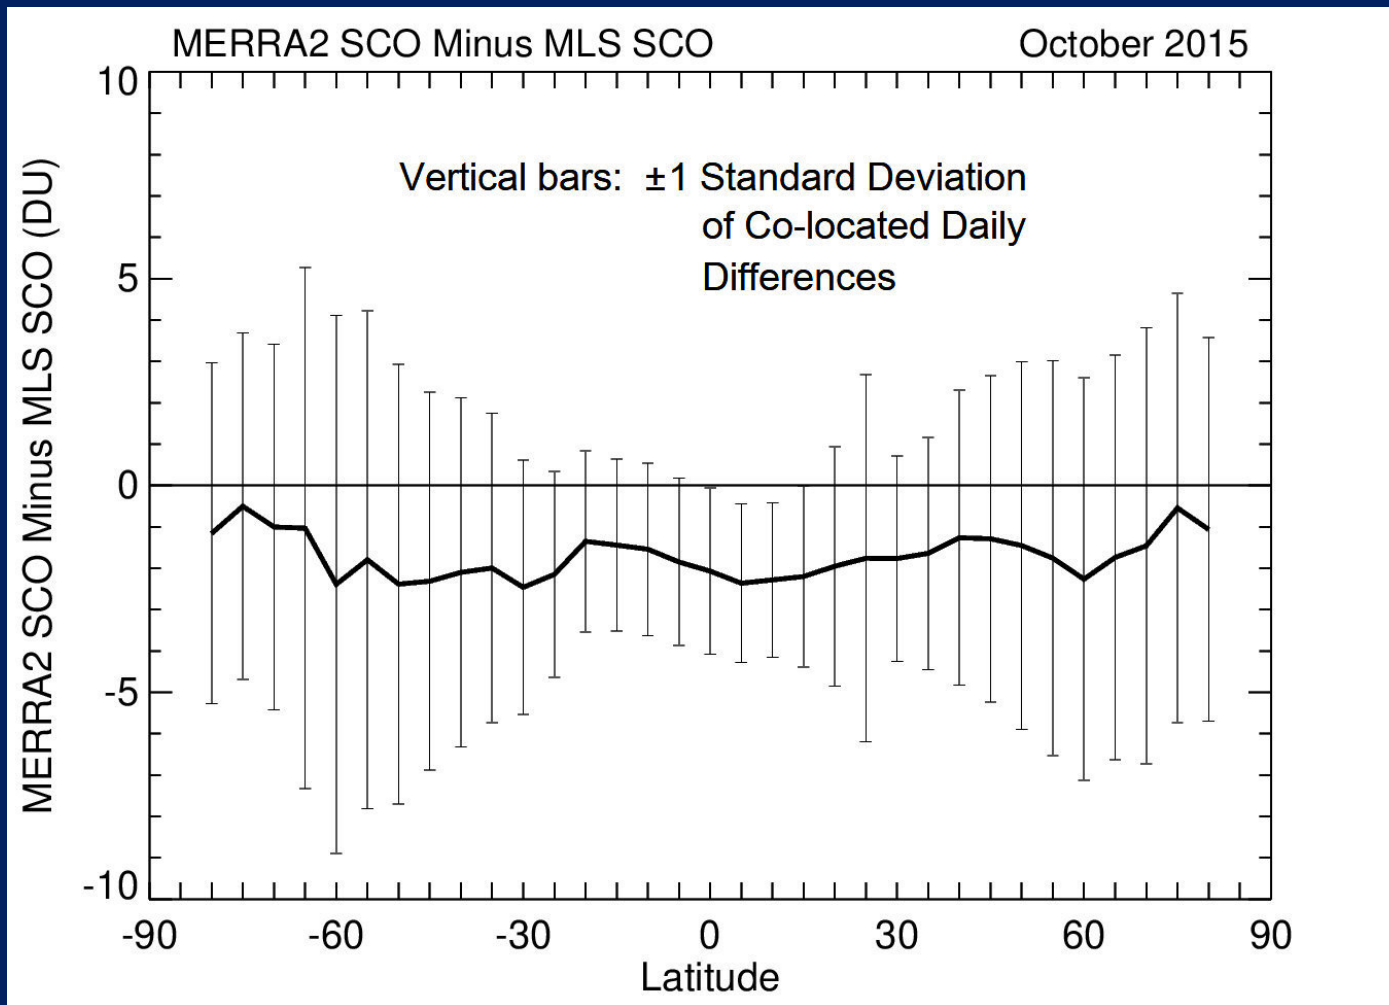

How Good is MERRA-2 Daily SCO?

MERRA-2 SCO Minus MLS SCO

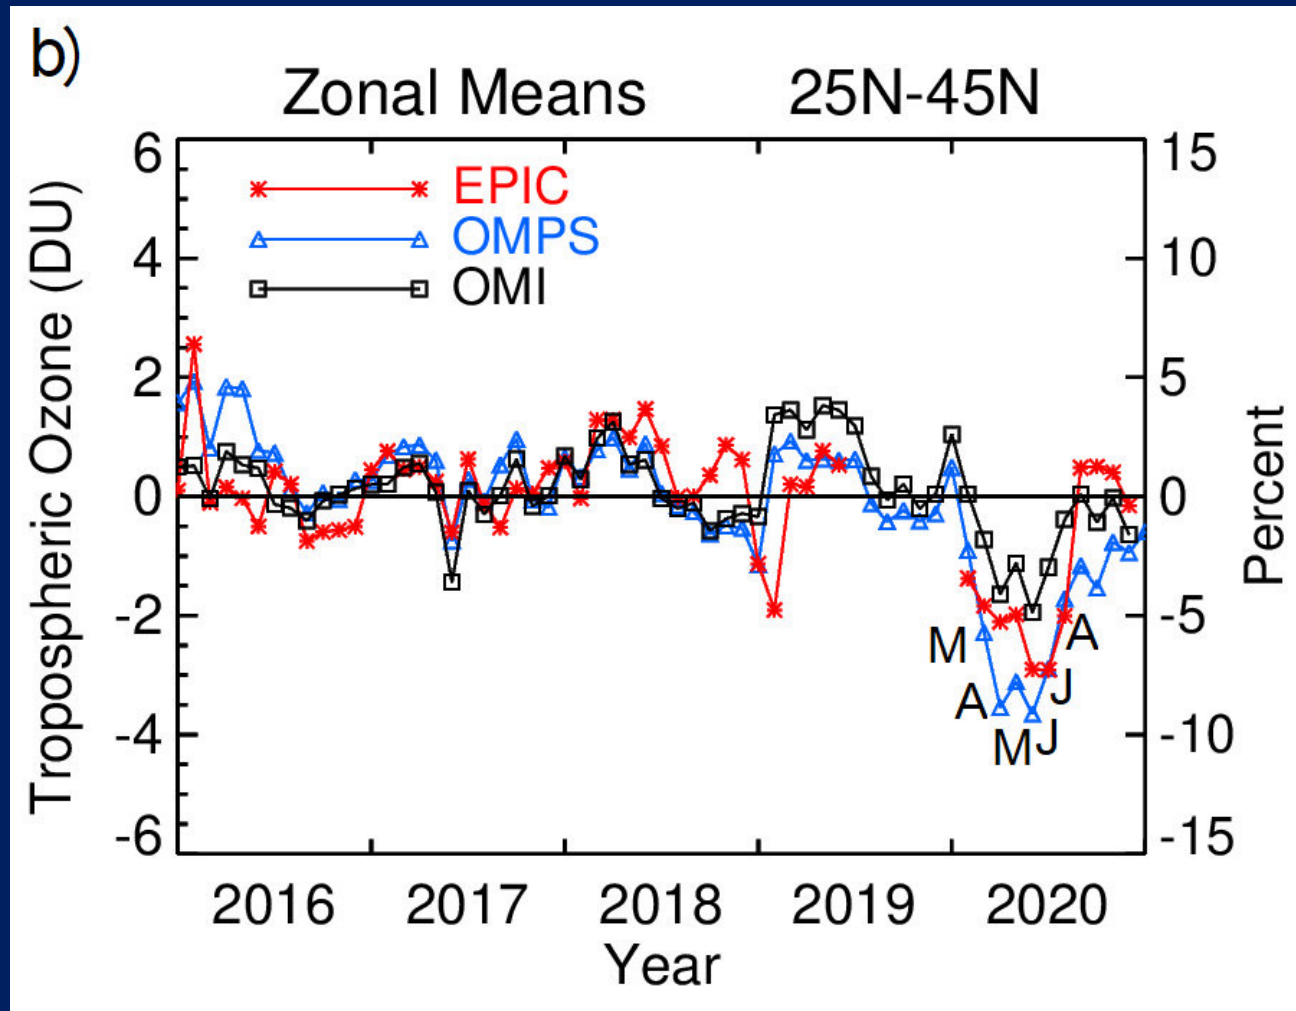

October 2015

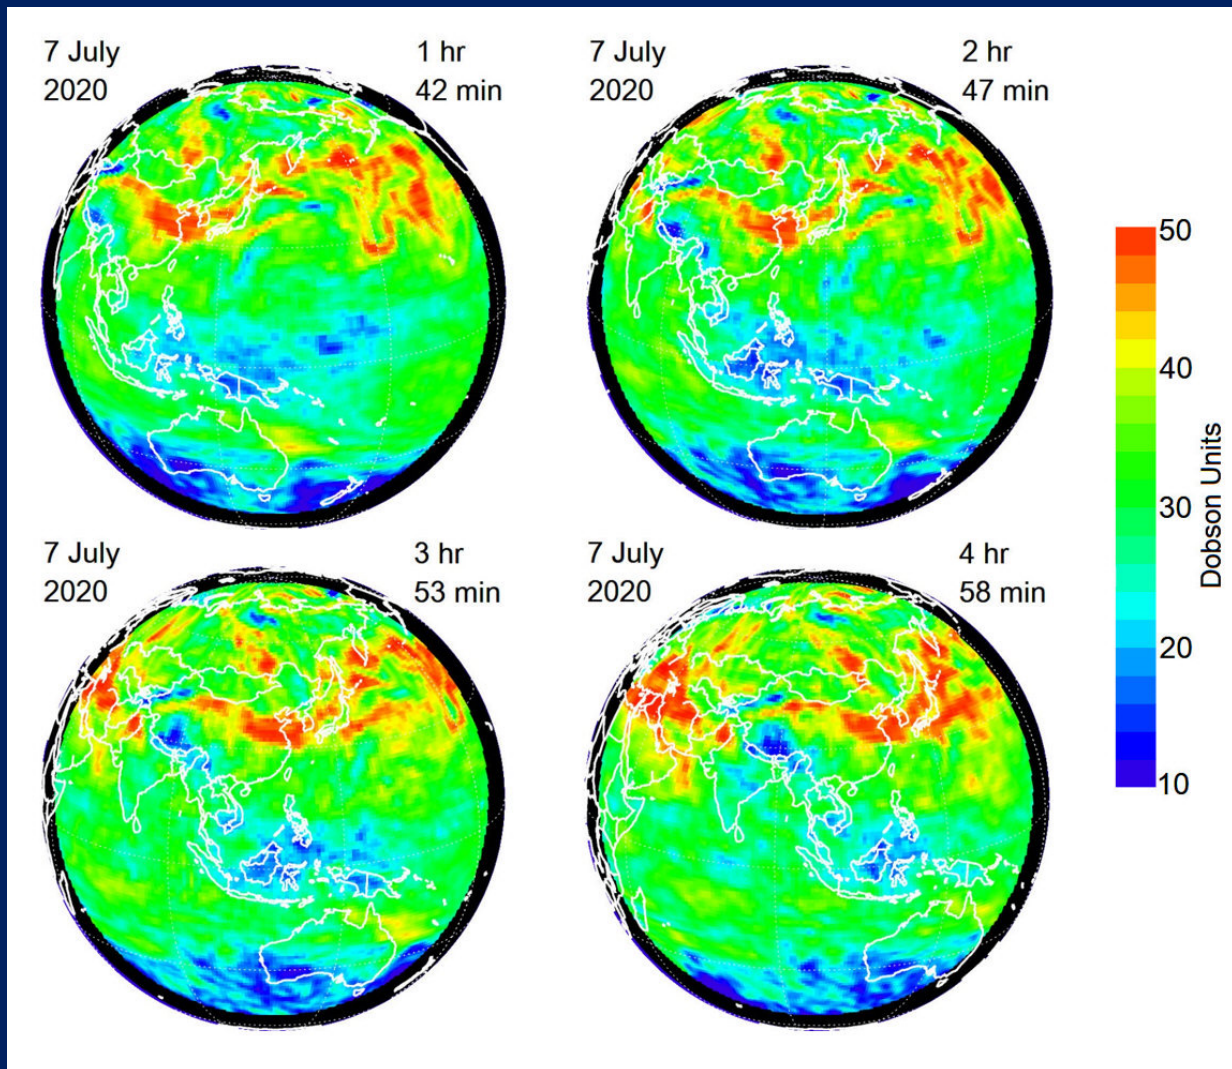

Answer: ~2-3 DU offsets from MLS SCO

Zonal-Mean TOR from Satellite Shows 2-4 DU (~5-10%) Anomalous Reductions in 2020

EPIC Hourly Maps of TOR

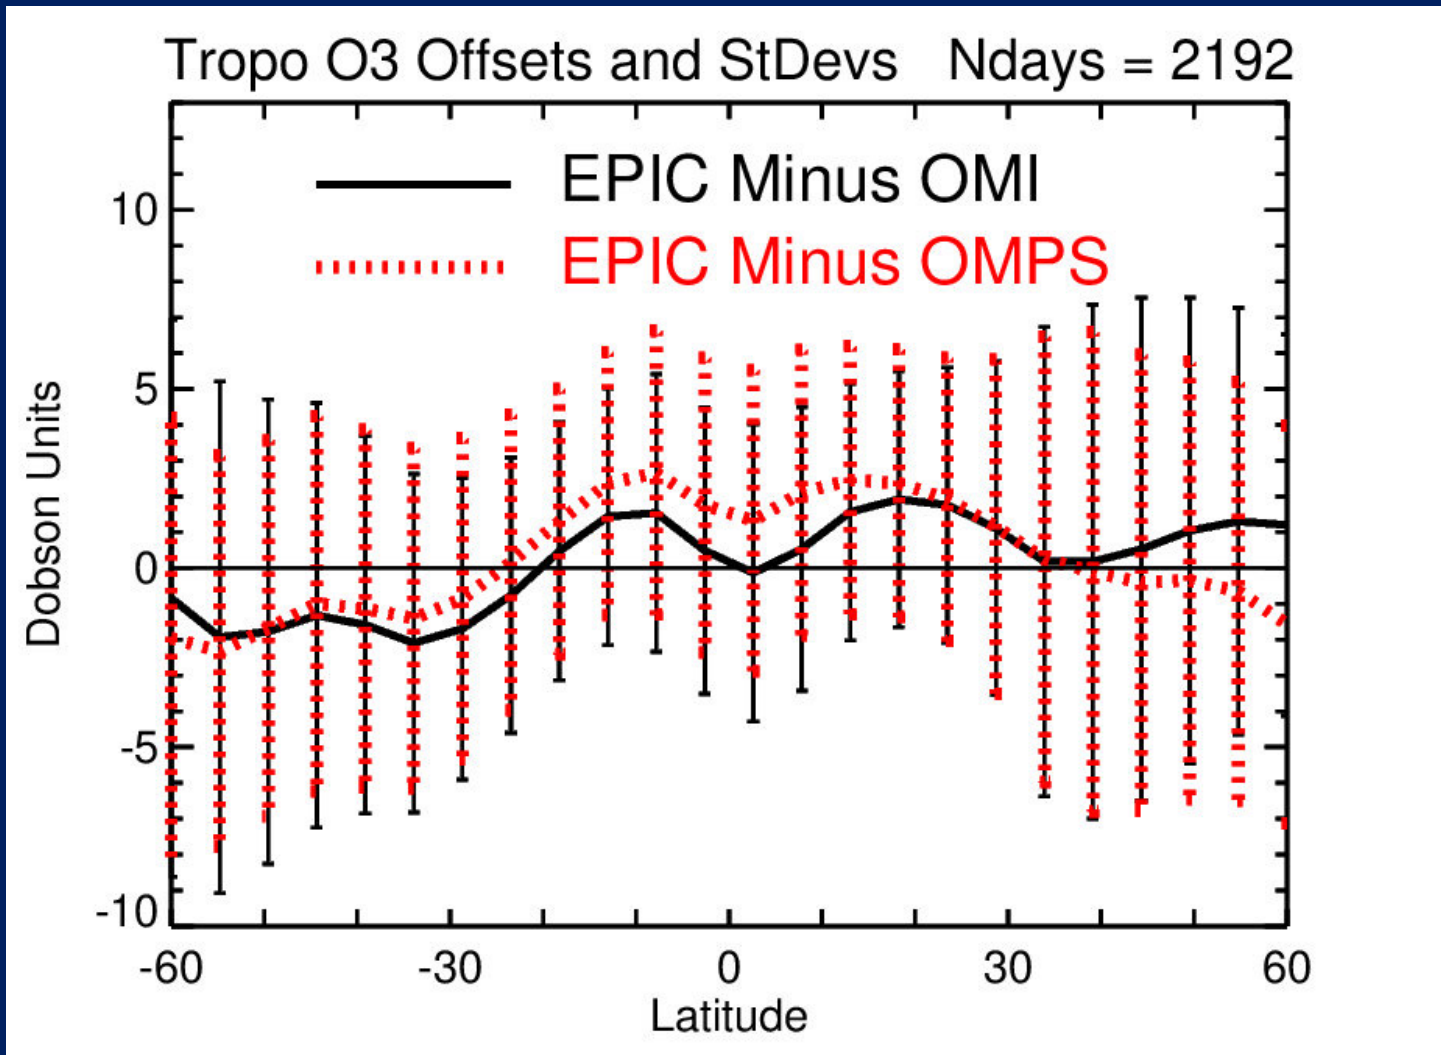

EPIC is “pathfinder” for current and upcoming geostationary ozone measurements such as from GEMS, TEMPO, and Sentinel-4

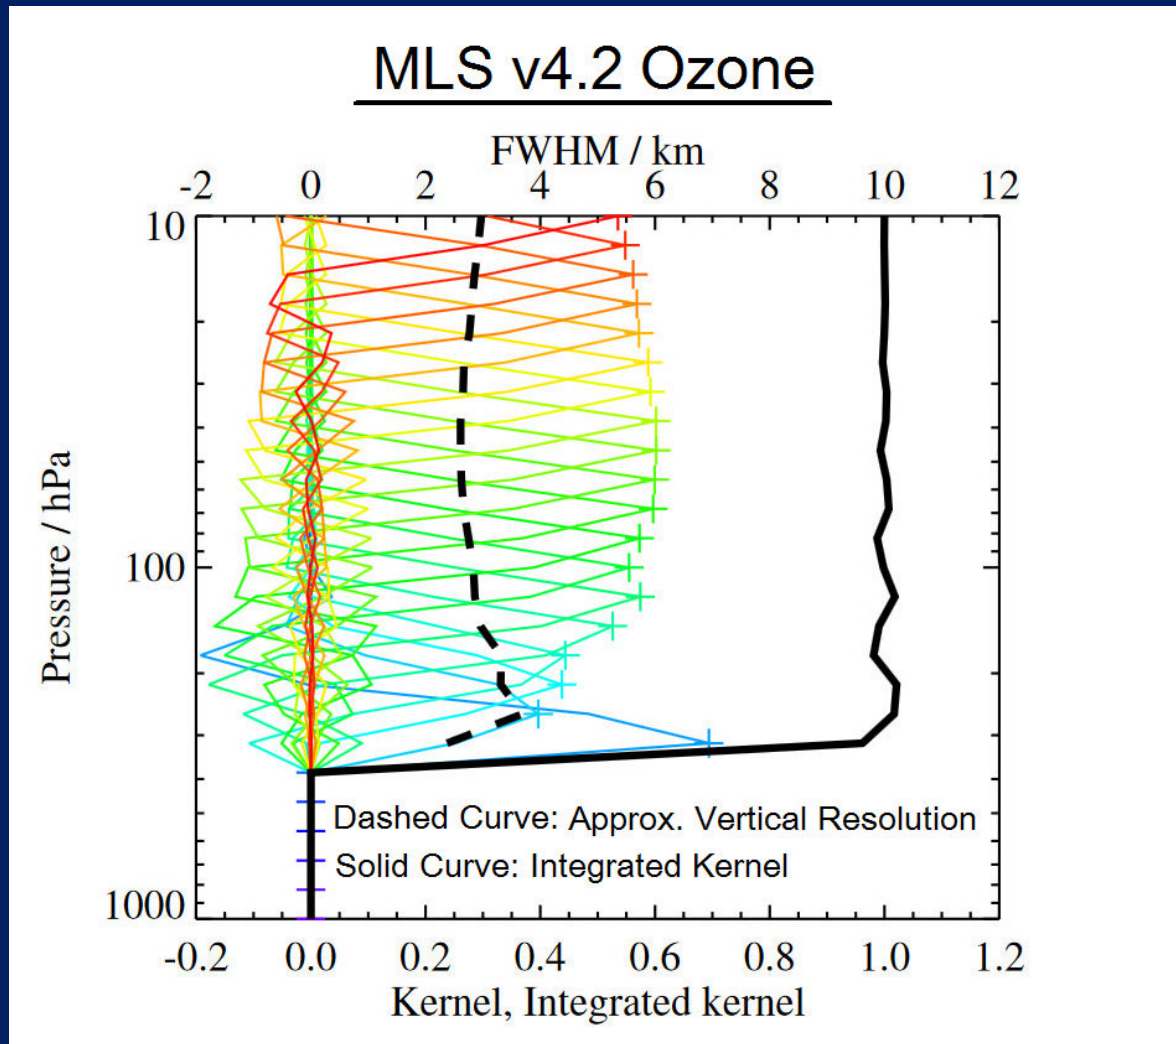

Satellite Zenith Angles < 70°

(Western Pacific, simulates GEMS)

Satellite TOR Inter-Comparisons

Why Use Assimilated MLS Ozone for the Stratosphere?

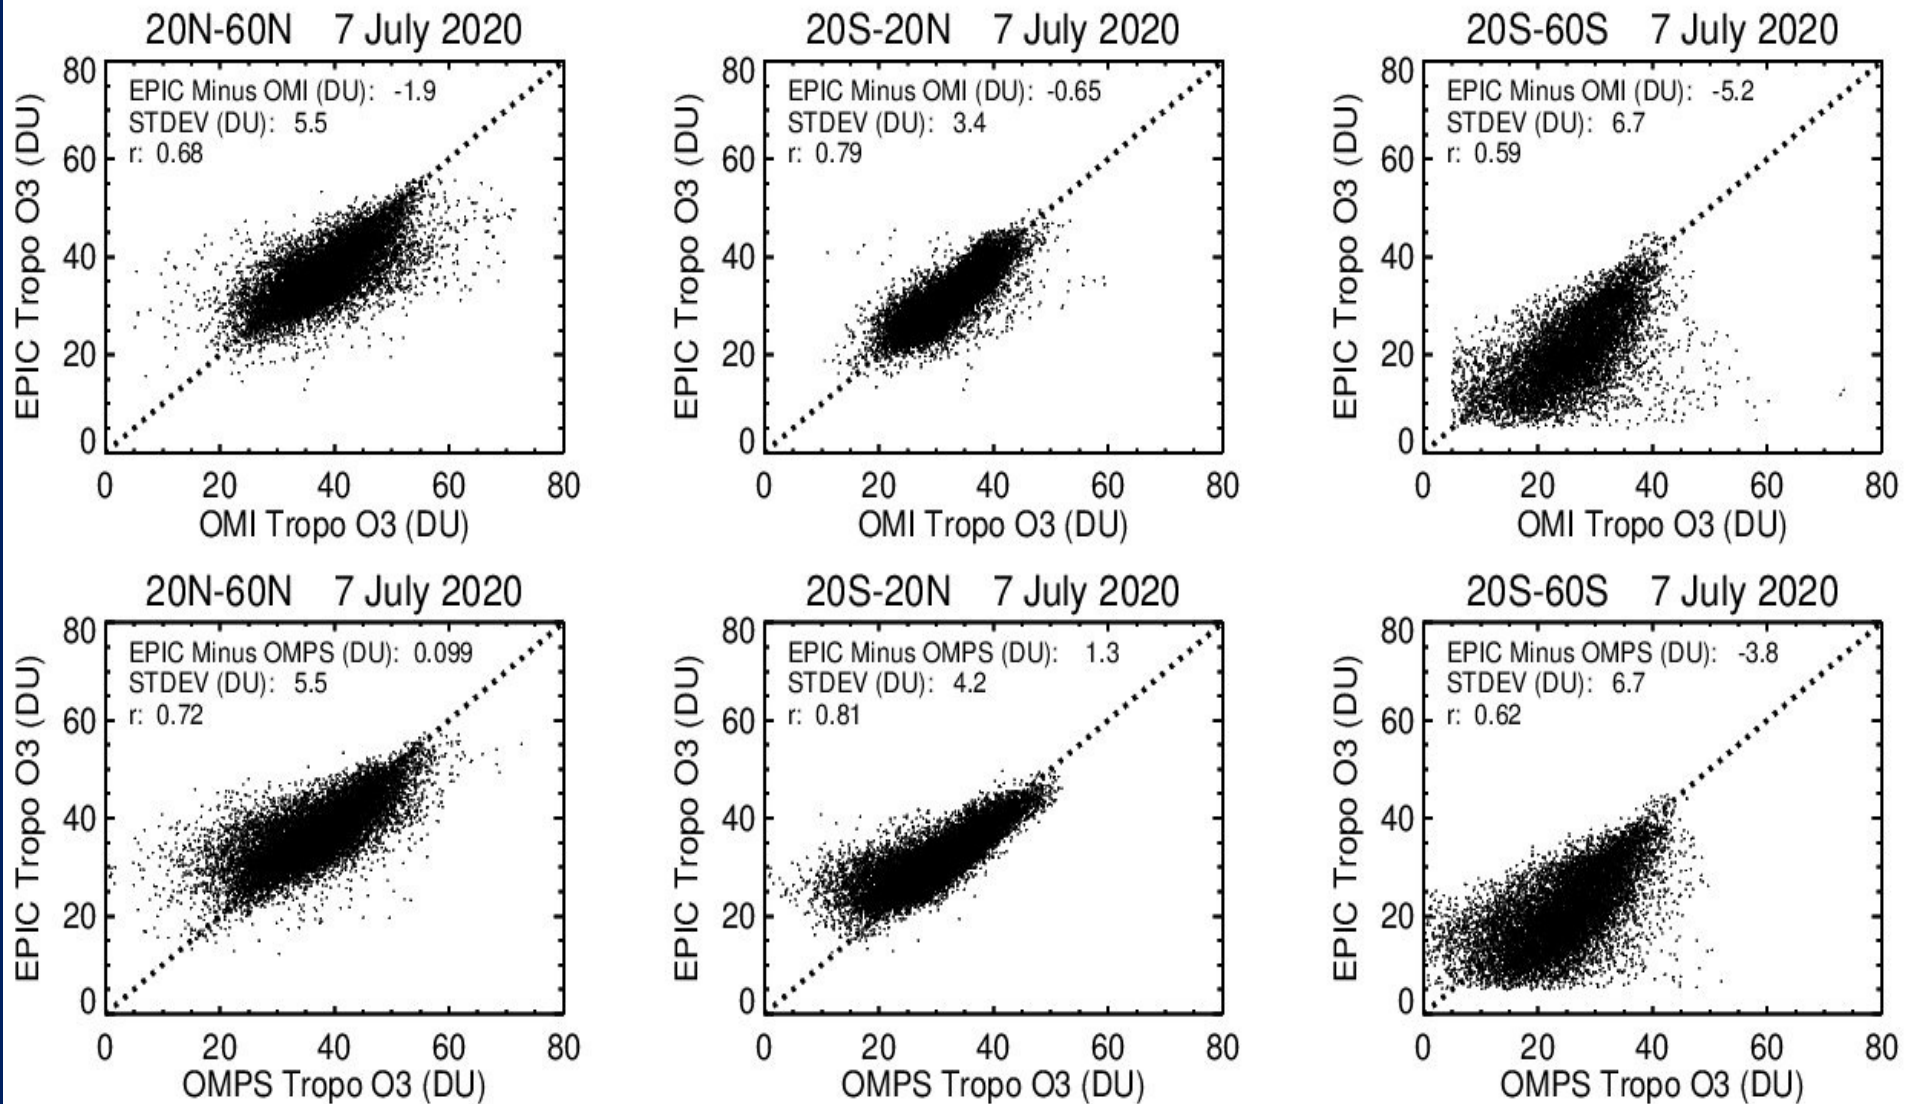

MLS vertical resolution for ozone is ~ 3 km including near the tropopause

MERRA2 assimilated MLS ozone used for strat column O_3

(Est. pixel accuracy and precision $\sim 2-3$ DU and 2-4 DU, resp.)

(MLS v4.2 Data Documentation User's Guide)

Satellite TOR Inter-Comparisons

MLS Daytime Strat O3

15 July 2020

Dobson Units

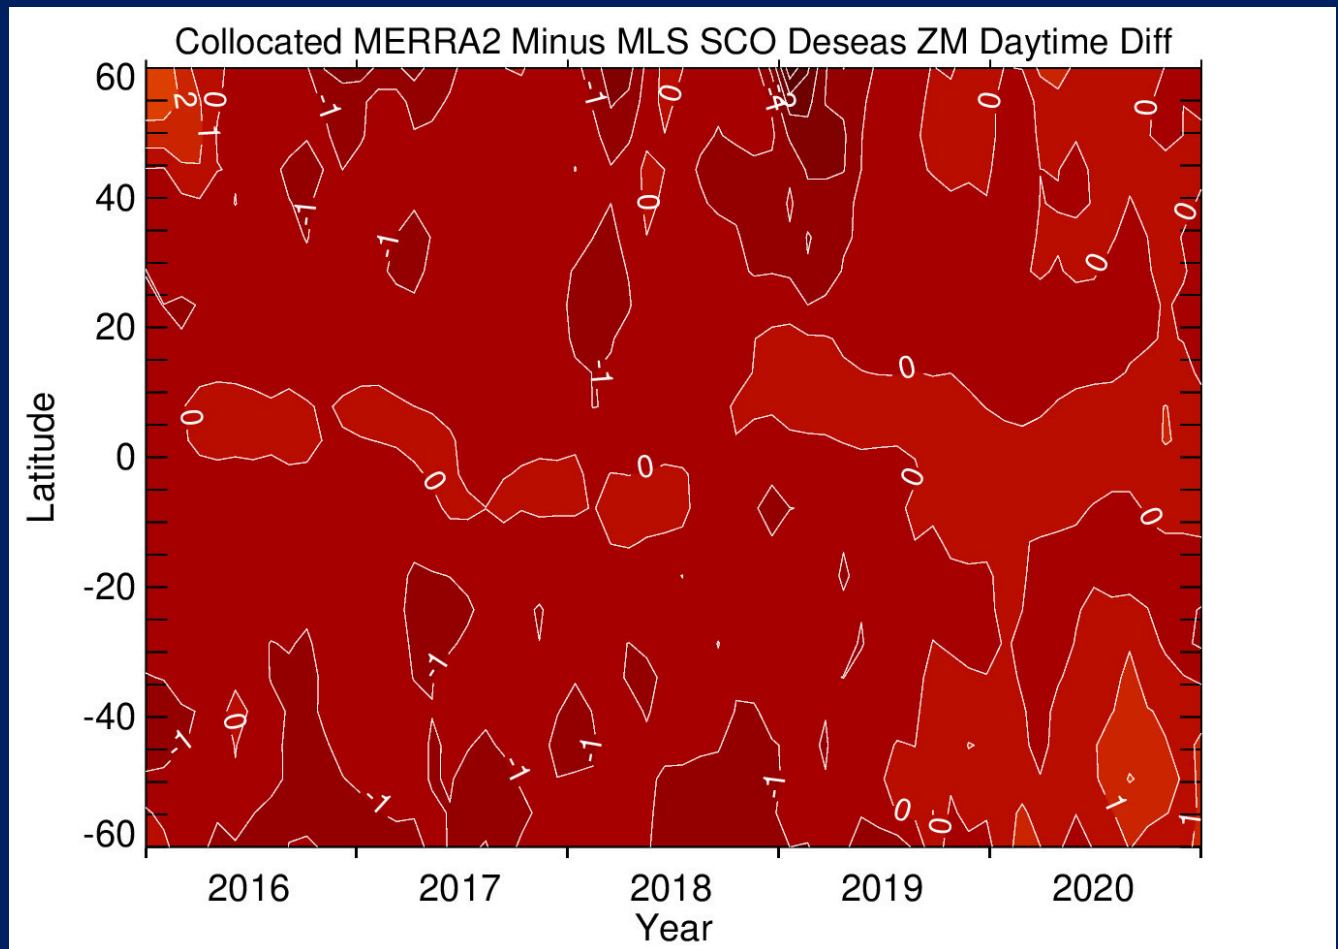

Inter-Annual Changes in MERRA2 SCO is Essentially Equivalent to Co-located MLS SCO to within ± 1 DU

Daily along-track
MLS SCO is space-
time co-located with
daily MERRA2 SCO
pixels, which is then

(1) Differenced

(2) Deseasonalized

(3) zonally averaged

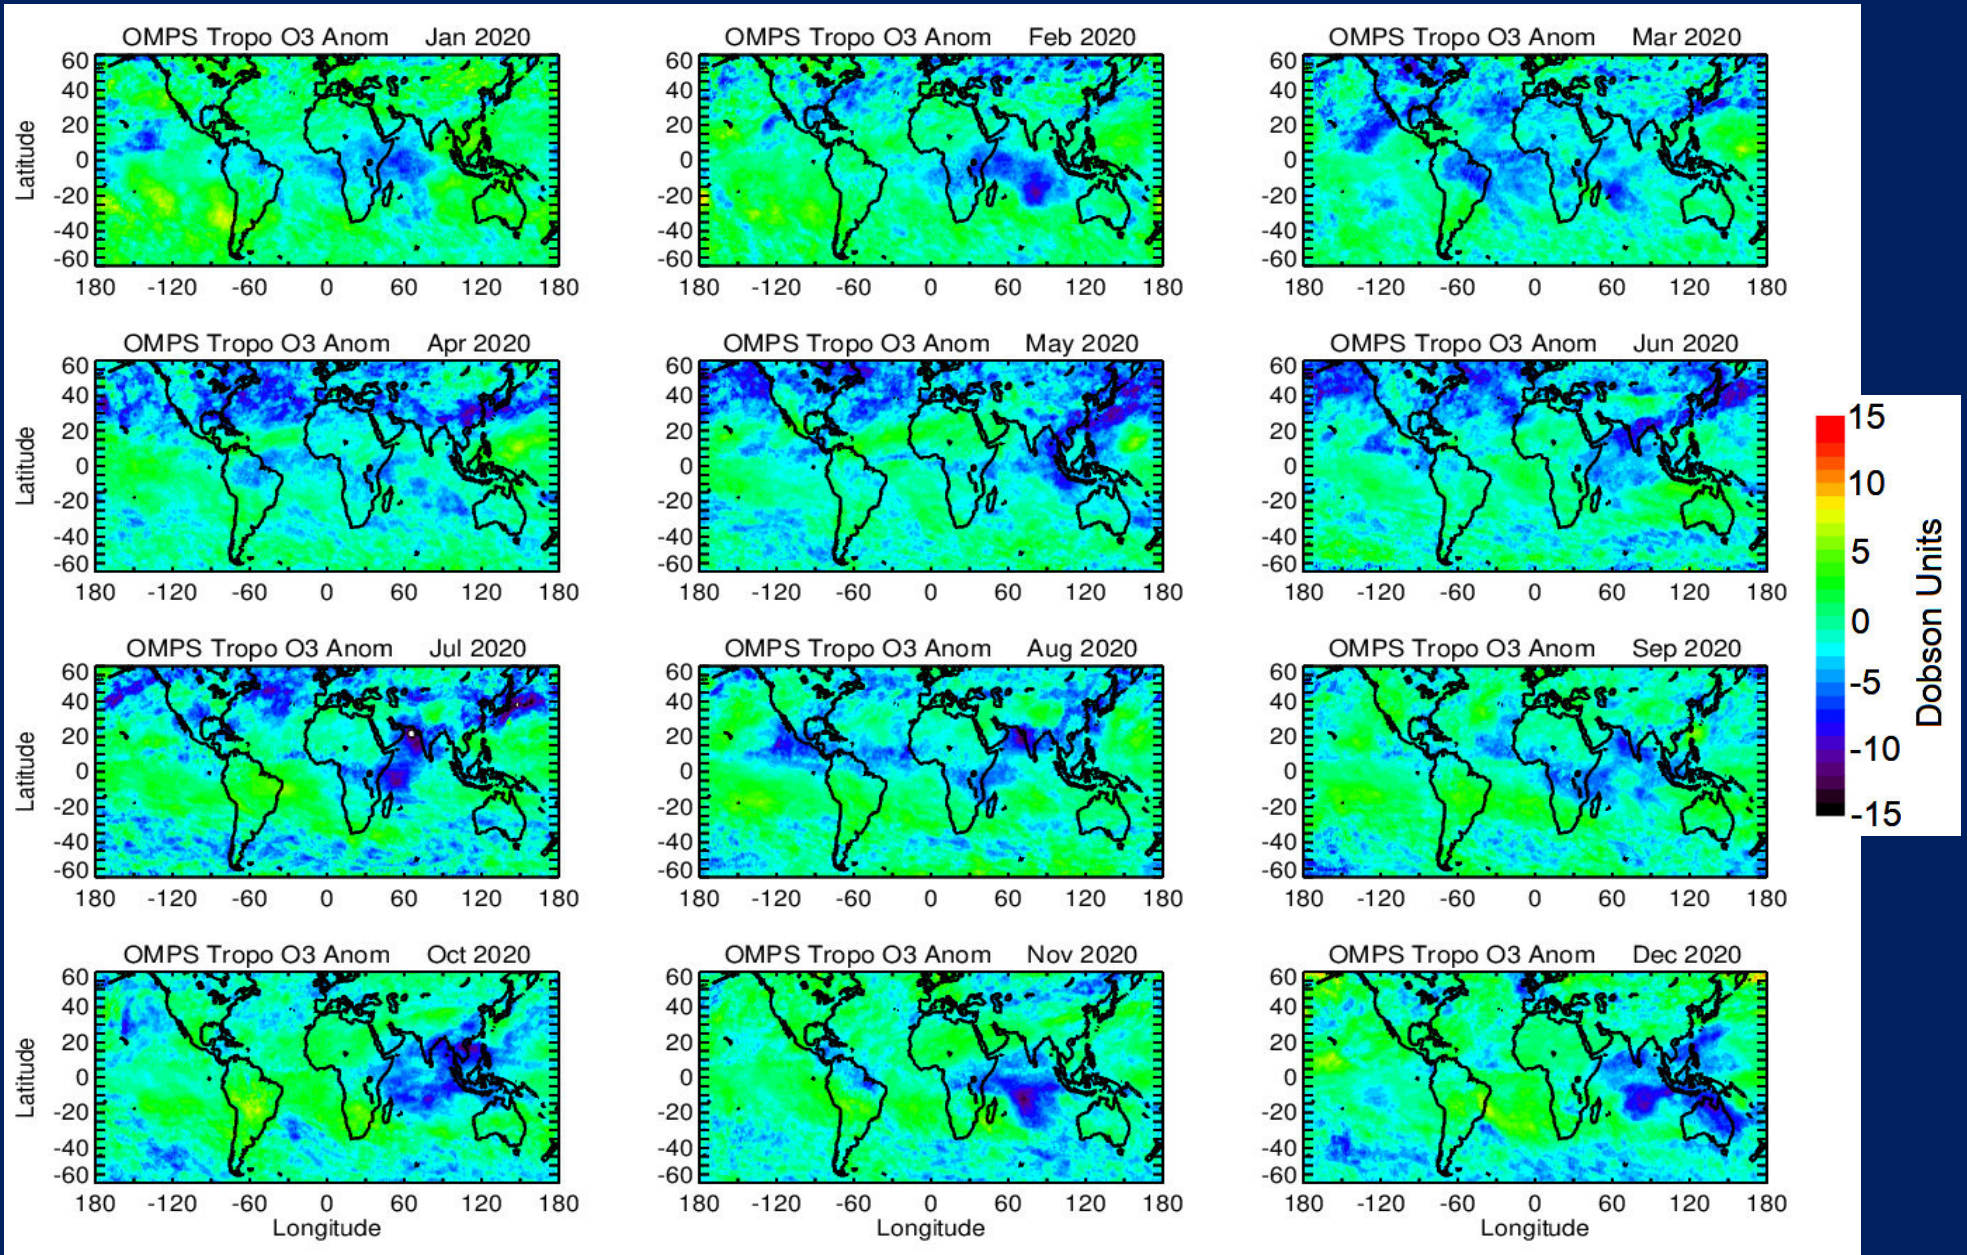

EKMA Diagram (Ozone Isopleth) Diagram for Summer Months

If "NO_x limited" in summertime:

Reductions in pollution NO_x leads to reductions in ozone

OMPS: Reduced Tropospheric Ozone in NH/Tropics in 2020

(Oct-Dec 2020 Was Strong La Nina: Produced LOW Tropo O₃ over west Pacific)
